

Niagara University New Science Building Niagara, New York

The University conducted a space allocation study for the new building to ascertain the feasibility of including psychology, mathematics and computer and information sciences in the building along with the sciences. It was determined that while the purpose was excellent in the synergy created among those departments, the size of this building and its cost would mitigate against construction at this time.

The University has decided to go forward with its most urgent need and construct a building to house the sciences: biology, bioinformatics, chemistry, computational chemistry, and physics. URS Corporation was chosen to provide Architectural/Engineering Services for the full design of the new science building which will be housing the biology and chemistry departments.

It is desired that the building would be designed with thought given to enlarging the building in the future. URS will value an effective innovative design that provides excellent facilities and that promotes collaboration and sharing of resources.
